

# Impact category: Climate Change

Term	Example
<b>Impact category</b>	Climate Change
<b>LCI results</b>	Amount of a greenhouse gas per functional unit
<b>Characterization model</b>	Baseline model of 100 years of the Intergovernmental Panel on Climate Change
<b>Category indicator</b>	Infrared radiative forcing (W/m <sup>2</sup> )
<b>Characterization factor</b>	Global warming potential (GWP100) for each greenhouse gas (kg CO <sub>2</sub> -equivalents/kg gas)
<b>Category indicator result</b>	Kilograms of CO <sub>2</sub> -equivalents per functional unit
<b>Category endpoints</b>	Coral reefs, forests, crops
<b>Environmental relevance</b>	Infrared radiative forcing is a proxy for potential effects on the climate, depending on the integrated atmospheric heat adsorption caused by emissions and the distribution over time of the heat absorption.

# Impact category: acidification

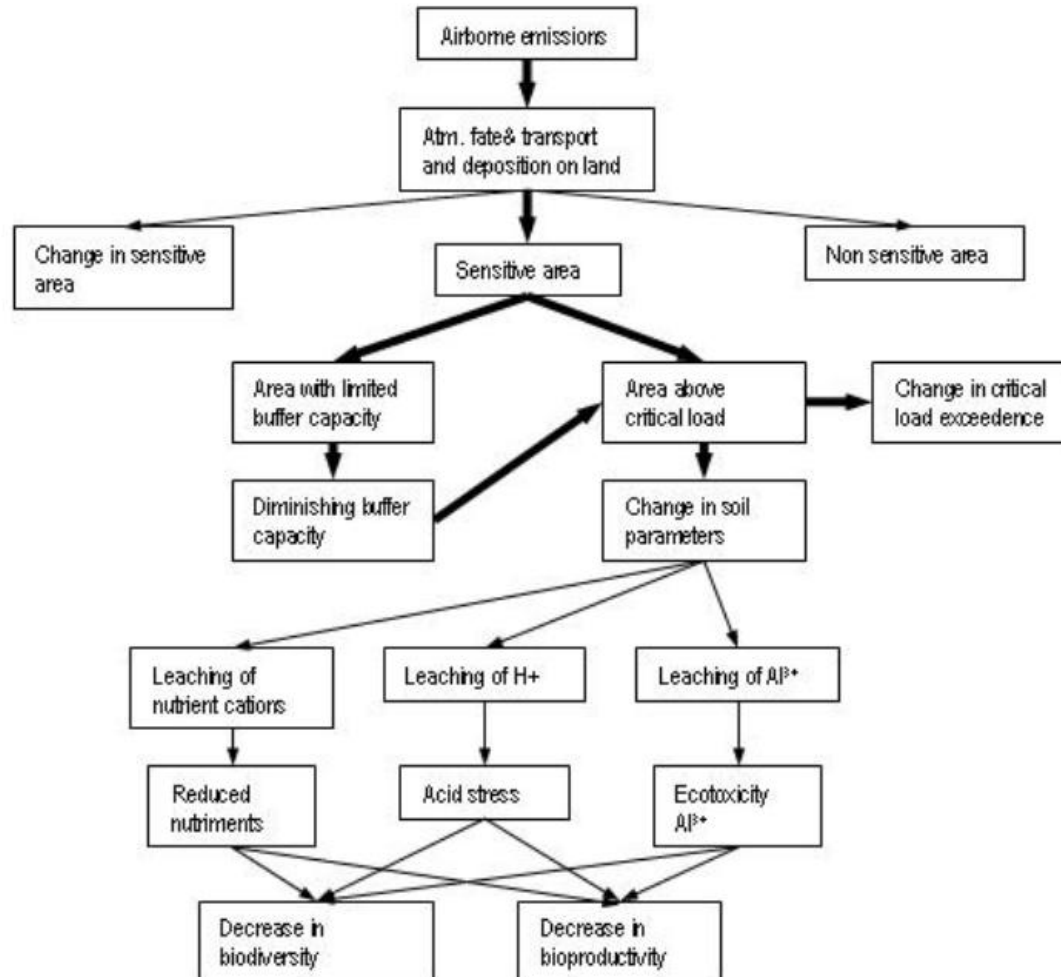

<b>Definition</b>	
<b>Impact indicator</b>	
<b>Characterization model</b>	
<b>Characterization factor</b>	
<b>Unit</b>	
<b>Categories of damage (Endpoint)</b>	

# Impact category: acidification

<b>Definition</b>	Assessment of the acidifying effects of anthropogenic emissions (NO <sub>x</sub> , SO <sub>2</sub> , NH <sub>3</sub> )
<b>Impact indicator</b>	Increasing acidity in water and soil systems through the hydrogen ion concentration
<b>Characterization model</b>	<ul style="list-style-type: none"><li>■ Consideration of the aeolian transport of substances, the transfer to the recipient (Environment), emitted mole of H<sup>+</sup> ions per kg of pollutants deposited and the change of the ecosystem at varying cation capacity</li><li>■ Models: IMPACT 2002+, CML 2001, ReCiPe 2008</li></ul>
<b>Characterization factor</b>	<ul style="list-style-type: none"><li>■ Acidification Potential</li><li>■ kg SO<sub>2</sub>-equivalent / kg emissions</li></ul>
<b>Unit</b>	kg SO <sub>2</sub> -equivalent
<b>Categories of damage (Endpoint)</b>	Damage to the ecosystem quality →decrease in biodiversity

# Impact category: acidification

Quelle: European Commission, 2010

# Impact categorie: Ozone depletion

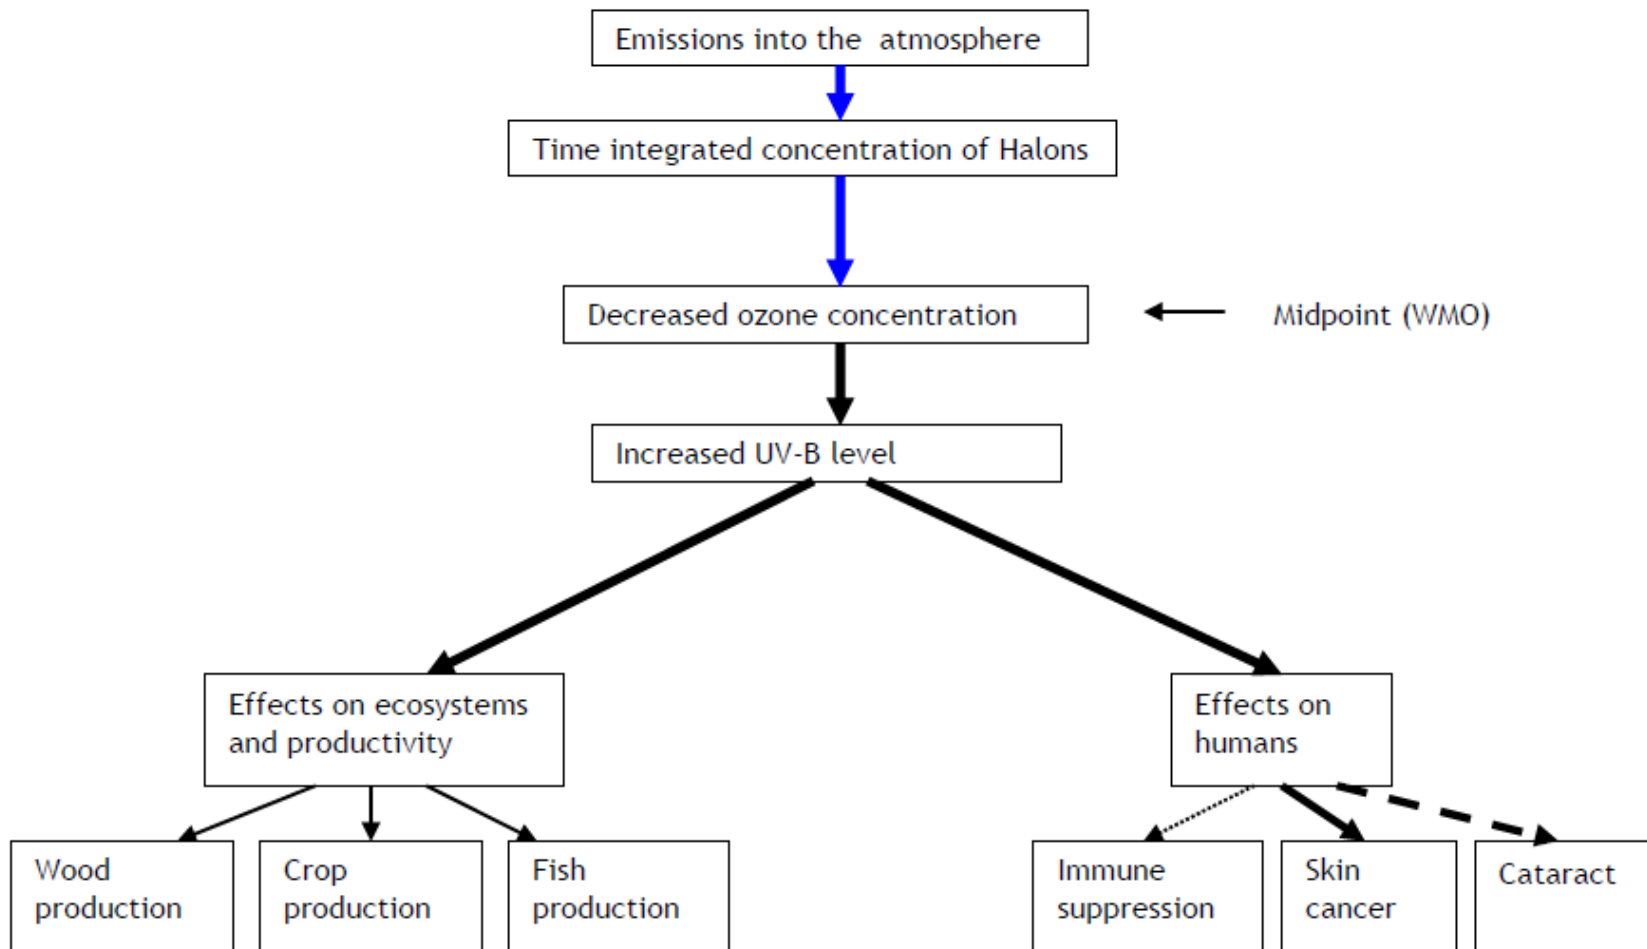

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

<b>Definition</b>	
<b>Impact indicator</b>	
<b>characterization model</b>	
<b>characterization factor</b>	
<b>Unit</b>	
<b>Categories of damage (Endpoint)</b>	

# Impact categorie: Ozone depletion

<b>Definition</b>	Assessment of the depletion of the stratospheric ozone layer due to anthropogenic emissions of ozone depleting substances (CFCs in particular)
<b>Impact indicator</b>	Decreasing stratospheric ozone concentration: prevents ultraviolet UV-B radiation from entering the atmosphere
<b>characterization model</b>	<ul style="list-style-type: none"><li>■ Consideration of the atmospheric residence time of ozone depleting substances, the formation of EESC (= Equivalent Effective Stratospheric Chlorine) and the resulting stratospheric ozone depletion</li><li>■ Models: CML 2001, ReCiPe 2008</li></ul>
<b>characterization factor</b>	<ul style="list-style-type: none"><li>■ ODP = ozone depletion potential, relative measure to build a EESC</li><li>■ kg CFC-11-equivalent/kg emissions</li></ul>
<b>Unit</b>	kg CFC-11-equivalent
<b>Categories of damage (Endpoint)</b>	Human health, ecosystem quality

# Impact categorie: Ozone depletion

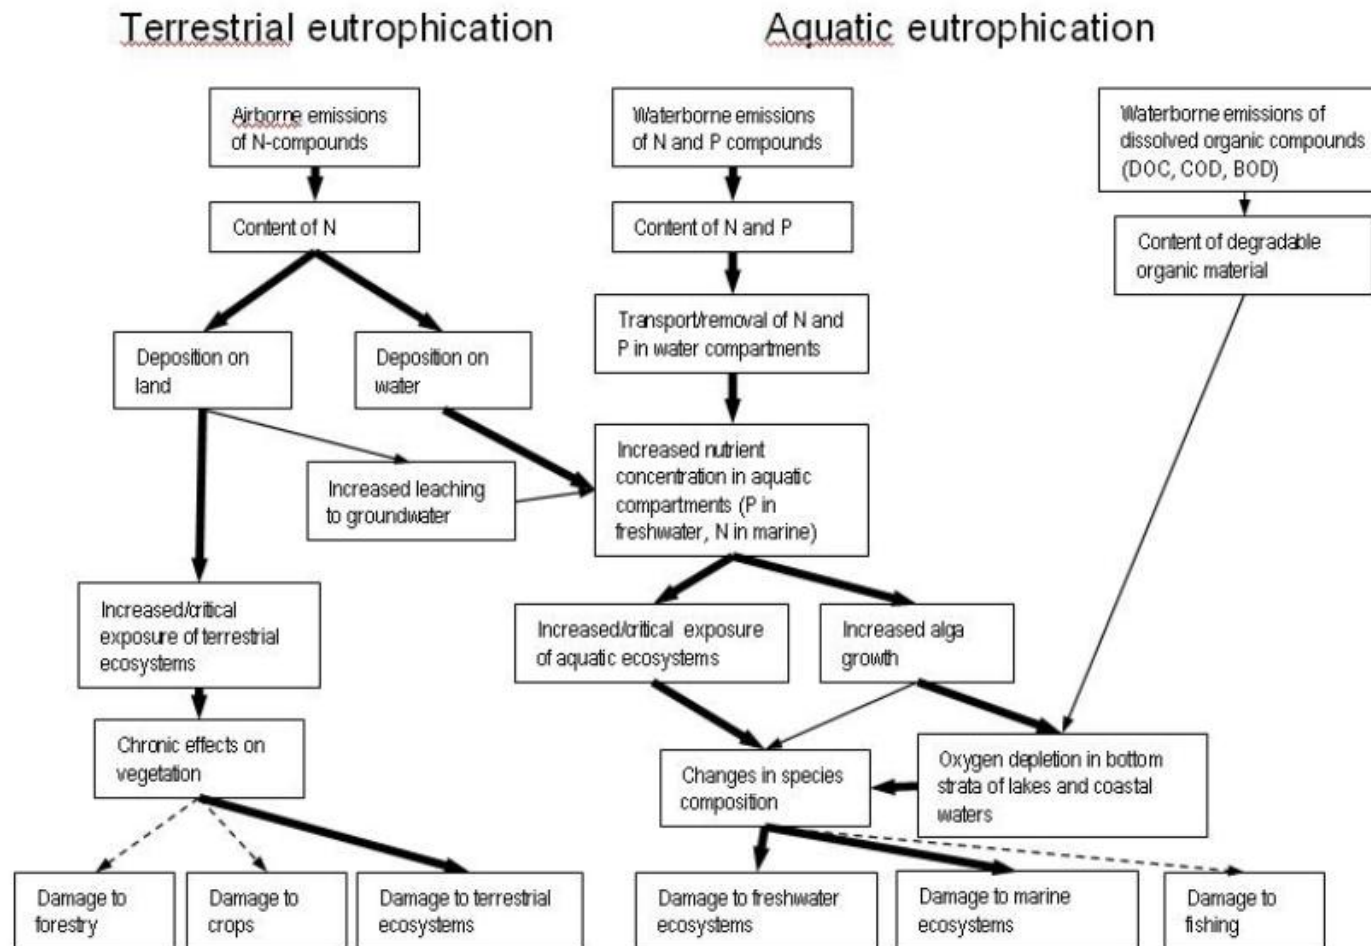

Quelle: European Commission, 2010

# Impact category: eutrophication

<b>Definition</b>	<p>= nitrification, nutrient accumulation</p> <ul style="list-style-type: none"> <li>■ Assessment of the effects caused by nutrient accumulation</li> <li>■ Distinction in terrestrial and aquatic (freshwater and marine) eutrophication</li> </ul>
<b>Impact indicator</b>	<ul style="list-style-type: none"> <li>■ Increase in the nitrogen respectively phosphorus concentration and the undesirable associated formation of biomass</li> <li>■ Terrestrial and marine: N-concentration</li> <li>■ Freshwater: P-concentration</li> </ul>
<b>Characterization model</b>	<ul style="list-style-type: none"> <li>■ Consideration of the transport of substances into the air or water, the transfer to the recipient (environment) and the change of the ecosystem at changing nutrient availability</li> <li>■ Models: IMPACT 2002+, CML 2001, ReCiPe 2008</li> </ul>
<b>Characterization factor</b>	<ul style="list-style-type: none"> <li>■ eutrophication potential</li> <li>■ kg PO<sub>4</sub>-equivalent/ kg emissions or kg NO<sub>3</sub>-equivalent/kg emissions</li> </ul>
<b>Unit</b>	kg PO <sub>4</sub> -equivalent or kg NO <sub>3</sub> -equivalent
<b>Damage categories (Endpoint)</b>	Damage to the ecosystem quality

# Impact category: eutrophication

Quelle: European Commission, 2010

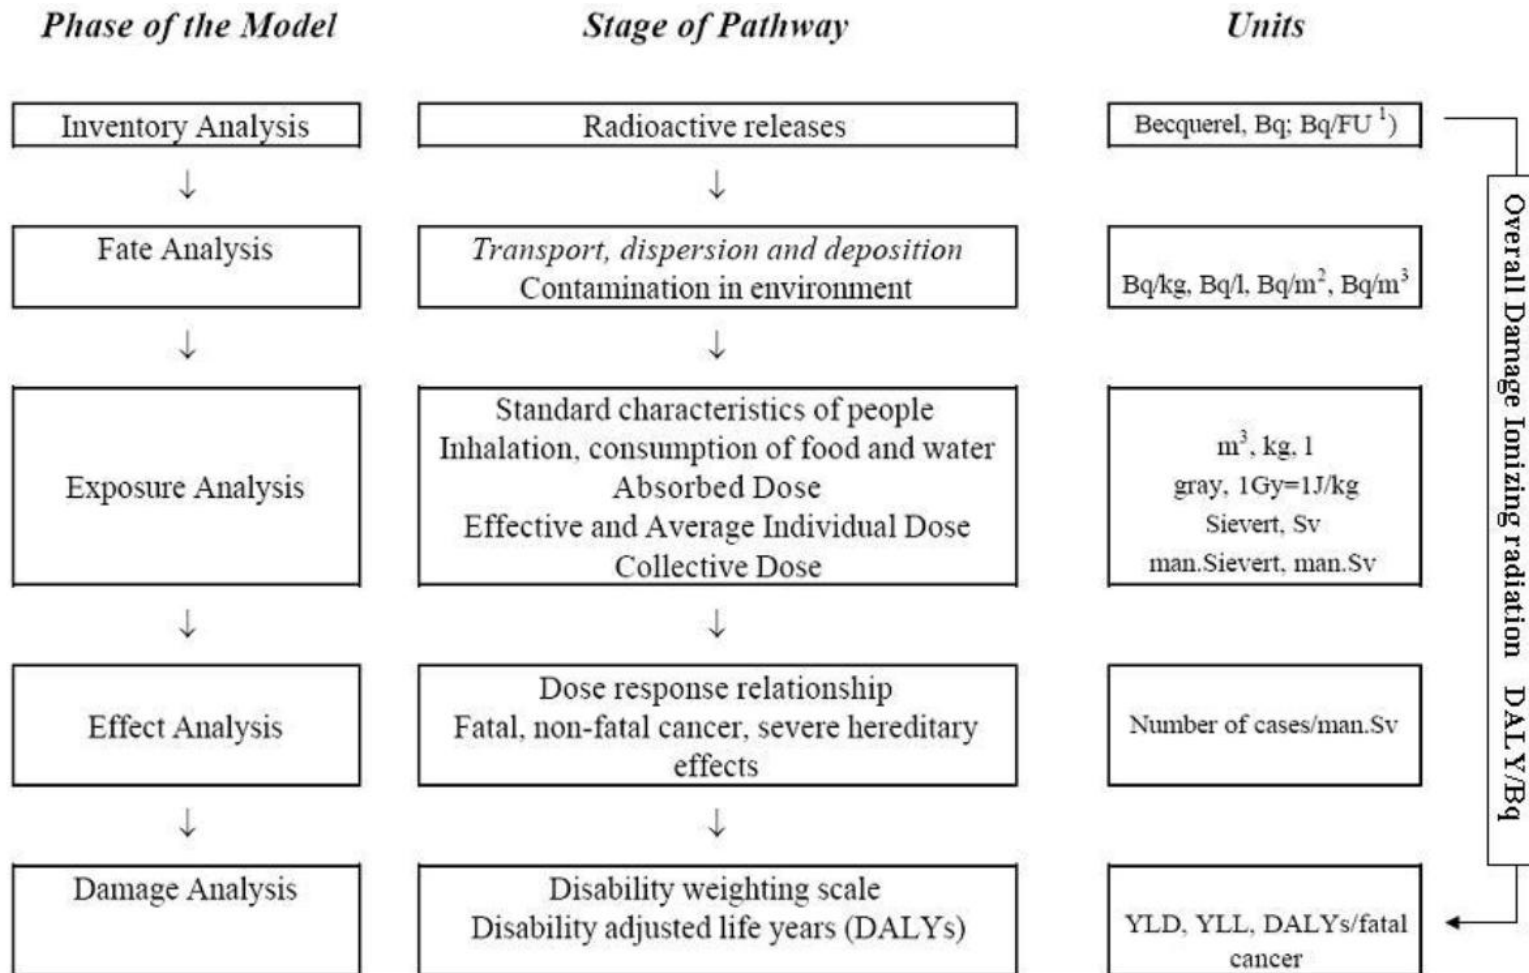

# Impact category : particulate matter/ respiratory inorganics

<b>Definition</b>	Assessment of the increase in particulate matter (PM) due to emission of primary and secondary particles
<b>Impact indicator</b>	Increase in: <ul style="list-style-type: none"> <li>■ TSP (total suspended particulates)</li> <li>■ PM10 (&lt;10 µm)</li> <li>■ PM2.5 (&lt;2.5 µm)</li> <li>■ PM0.1 (&lt;0.1 µm)</li> </ul>
<b>Characterization model</b>	<ul style="list-style-type: none"> <li>■ Consideration of the environmental behavior, the burden and the dose response of a pollutant for Midpoint and the severity for Endpoint</li> <li>■ Models: IMPACT 2002+, ReCiPe 2008</li> </ul>
<b>Characterization factor</b>	Particulate matter potential
<b>Unit</b>	kg particulate matter
<b>Damage categories (Endpoint)</b>	Human Health (Calculation of Years of Life Lost (YLL), Years of Life Disabled (YLD), and DALYs)

# Impact category: ionising radiation

<b>Definition</b>	<ul style="list-style-type: none"><li>■ Assessment of the effects of ionizing radiation on humans and the environment</li><li>■ Ionizing radiation types: <math>\alpha</math>-, <math>\beta</math>-, <math>\gamma</math>-rays and neutrons</li></ul>
<b>Impact indicator</b>	Effects by the absorbed dose
<b>Characterization model</b>	<ul style="list-style-type: none"><li>■ Taken into account the emissions emitted and calculation of their radiation behavior and burden, based on detailed nuclear-physical knowledge</li><li>■ based on the same framework conditions as human toxicity and ecotoxicity</li><li>■ Models: IMPACT 2002+, ReCiPe 2008</li></ul>
<b>Characterization factor</b>	ionising radiation potential
<b>Unit</b>	kg U <sup>235</sup>
<b>Damage categories (Endpoint)</b>	Human health, ecosystem quality

# Impact category: ionising radiation

Quelle: European Commission, 2010

# Impact category: ionising radiation

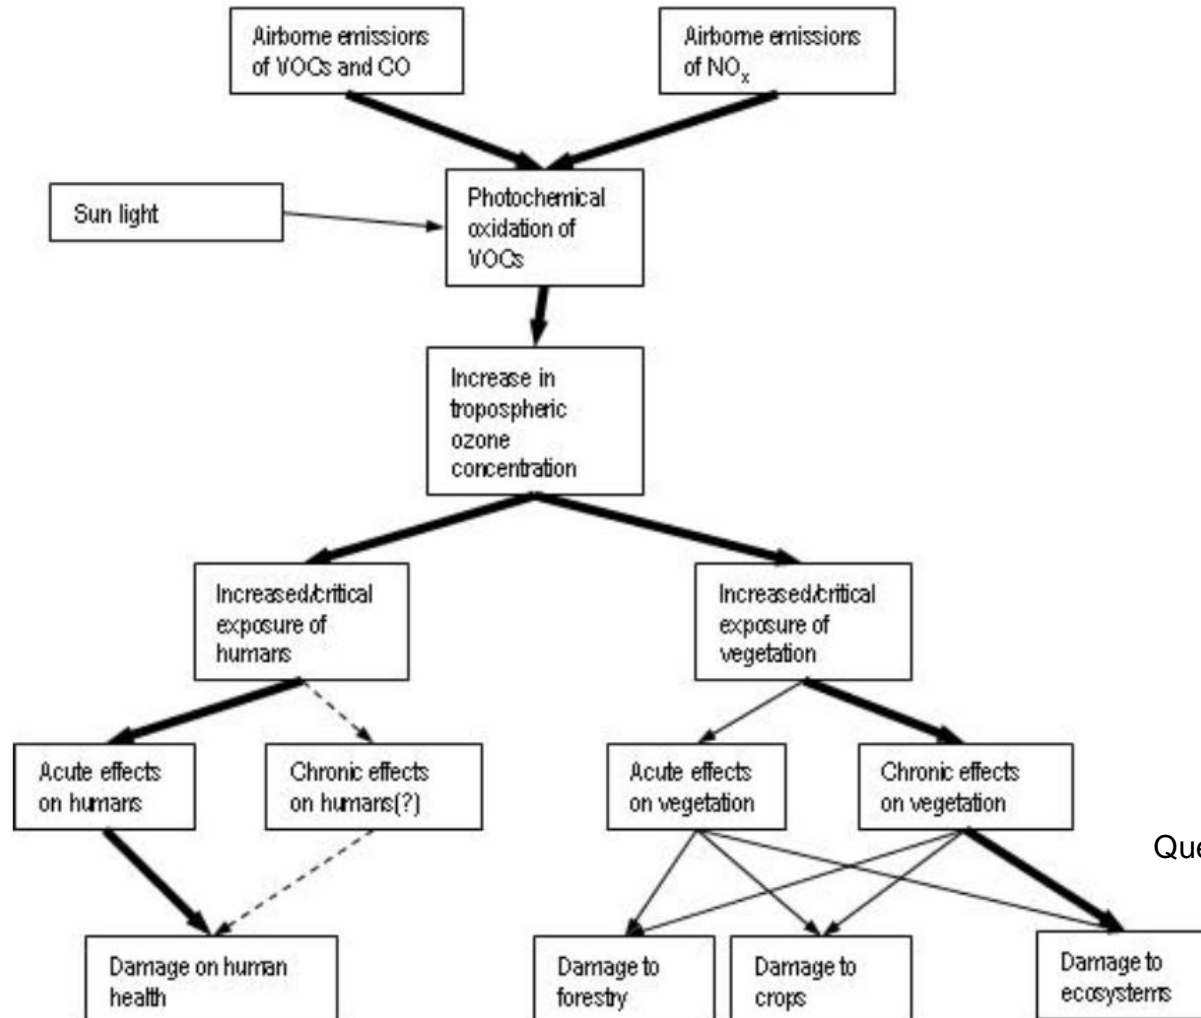

Quelle: European Commission, 2010

# Impact category: photochemical ozone formation

<b>Definition</b>	Assessment of the effects of smog on humans and the environment caused by VOCs, CO and NO <sub>x</sub>
<b>Impact indicator</b>	Increase in the photochemical formed ozone (smog)
<b>Characterization model</b>	Two different types of models: <ul style="list-style-type: none"><li>■ nonlinear/dynamic: Consideration of the Meteorology, the chemical composition of the atmosphere and associated emissions of other air pollutants</li><li>■ Simplified: individual VOCs are neglected and only a few characteristic factors are calculated</li></ul>
<b>Characterization factor</b>	Photochemical ozone creation potential (POCP) or Maximum Incremental Reactivity (MIR)
<b>Unit</b>	kg NMVOC (=non methane volatile organic carbon compound)
<b>Damage categories (Endpoint)</b>	Human health, ecosystem quality

# Impact category: photochemical ozone formation

Quelle: European Commission, 2010

# Selection of impact categories

## Often used impact categories:

- climate change
- stratospheric ozone depletion
- acidification
- eutrophication
- particulate matter
- ionizing radiation
- photochemical ozone formation
- resource depletion
- loss of soil / soil degradation
- toxicity

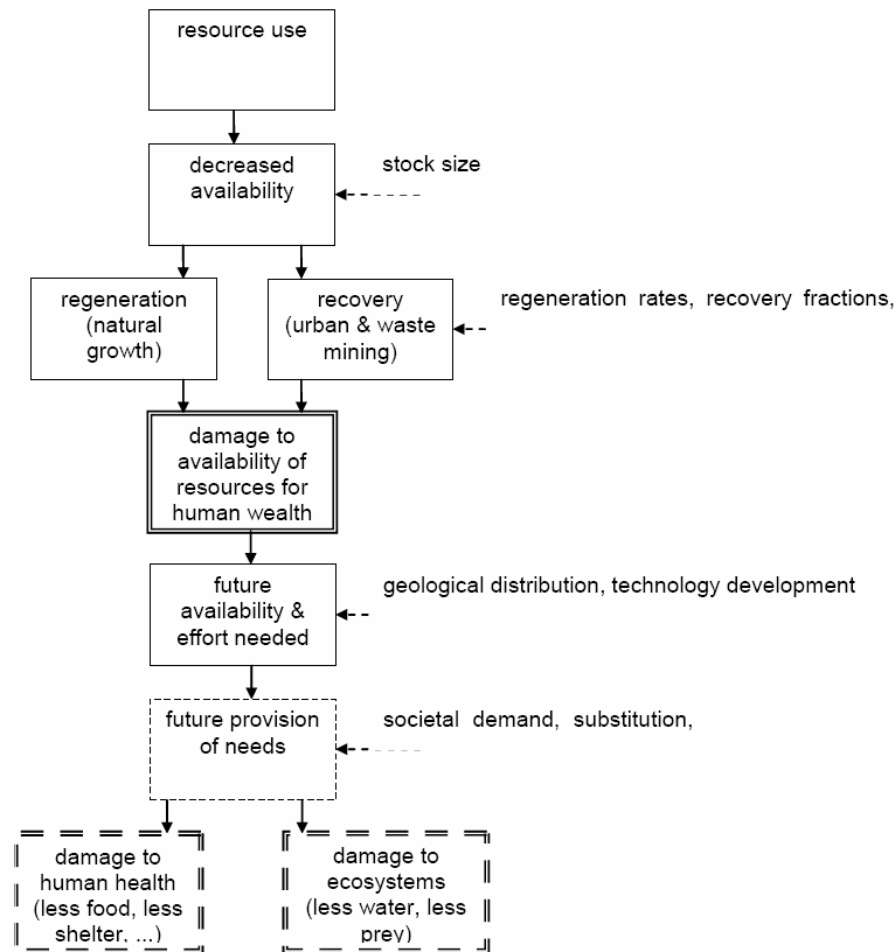

**Type of intervention:** material usage

# Impact category: resource depletion

<b>Definition</b>	Decreasing availability of resources as a result of their use outside of the rate of renewal / replacement
<b>Impact indicator</b>	Decrease in non-renewable (minerals and fossil fuels) and renewable (hydro, wind, and wood) resources
<b>Characterization model</b>	Distinction in: <ul style="list-style-type: none"><li>■ renewable: model includes weight, volume, and exergy</li><li>■ nonrenewable: model includes either energy or mass, exergy or entropy, effects and the use of the storages (e.g. minerals to ground fuels with energy)</li><li>■ Models: IMPACT 2002+, ReCiPe 2008</li></ul>
<b>Characterization factor</b>	Resource depletion potential
<b>Unit</b>	<ul style="list-style-type: none"><li>■ Water consumption: m<sup>3</sup></li><li>■ Mineral resource depletion: kg</li><li>■ Fossil fuel depletion: MJ</li></ul>
<b>Damage categories (Endpoint)</b>	Damage to natural resources

# Impact category: resource depletion

Quelle: European Commission, 2010

# Selection of Impact categories

## Often used impact categories:

- climate change
- stratospheric ozone depletion
- acidification
- eutrophication
- particulate matter
- ionizing radiation
- photochemical ozone formation
- resource depletion
- loss of soil / soil degradation
- toxicity

### Type of intervention:

Land use

# Impact category: land use

<b>Definition</b>	Assessment of the impact of land use due to agriculture, anthropogenic settlement and extraction of minerals / resources
<b>Impact indicator</b>	Species loss, change in primary production, amount of organic dry matter content, soil loss
<b>Characterization model</b>	<ul style="list-style-type: none"><li>■ Observation of a particular area in a certain time, taking into account a quality indicator of a reference situation</li><li>■ Models: IMPACT 2002+, ReCiPe 2008</li></ul>
<b>Characterization factor</b>	land occupation/ transformation potential
<b>Unit</b>	m <sup>2</sup> /a
<b>Damage categories (Endpoint)</b>	Natural resource depletion

# Land use (I)

- Used area size ( $F_i$ ) per functional unit (FU)

Total impact effect = 
$$\sum_i F_i \left[ \frac{\text{m}^2}{\text{FE}} \right]$$

- Additional involvement of the usage type by usage categories

## Case 1

usage types
forest
agriculture
recuperation
traffic
water
industry
buildings

## Case 2

usage type	hemeroby	degree of naturalne
ecosystem unaffected	Ahemerobic	natural
no / occasional use	oligohemerobic	close to natural
Forestry, pastures, meadows	mesohemerobic	semi-natural
forest monocultures	Beta euhemerobic	conditionally-far from
Arable land, garden land, viticulture	Alpha euhemerobic	far from nature
Sports, mining areas, disposal sites	polyhemerobic	foreign to nature
sealing	Metahemerobic	artificially

# Land use (II)

- Description of the physical change ( $dQ_i$ ) of Surface properties ( $i$ ) over the useful life

- Flora and fauna
- Species (animals)
- Soil functions (water and nutrient cycle)
- design form

# Selection of Impact categories

## Often used impact categories:

- climate change
- stratospheric ozone depletion
- acidification
- eutrophication
- particulate matter
- ionizing radiation
- photochemical ozone formation
- resource depletion
- loss of soil / soil degradation
- toxicity } **Type of intervention:** Substance emission  
**Indikator:** Midpoint- and/or Endpoint-Indicator

# Impact category: toxicity

Toxicity can be divided into:

- Human toxicity
- Ecotoxicity

=> Different effect endpoints!

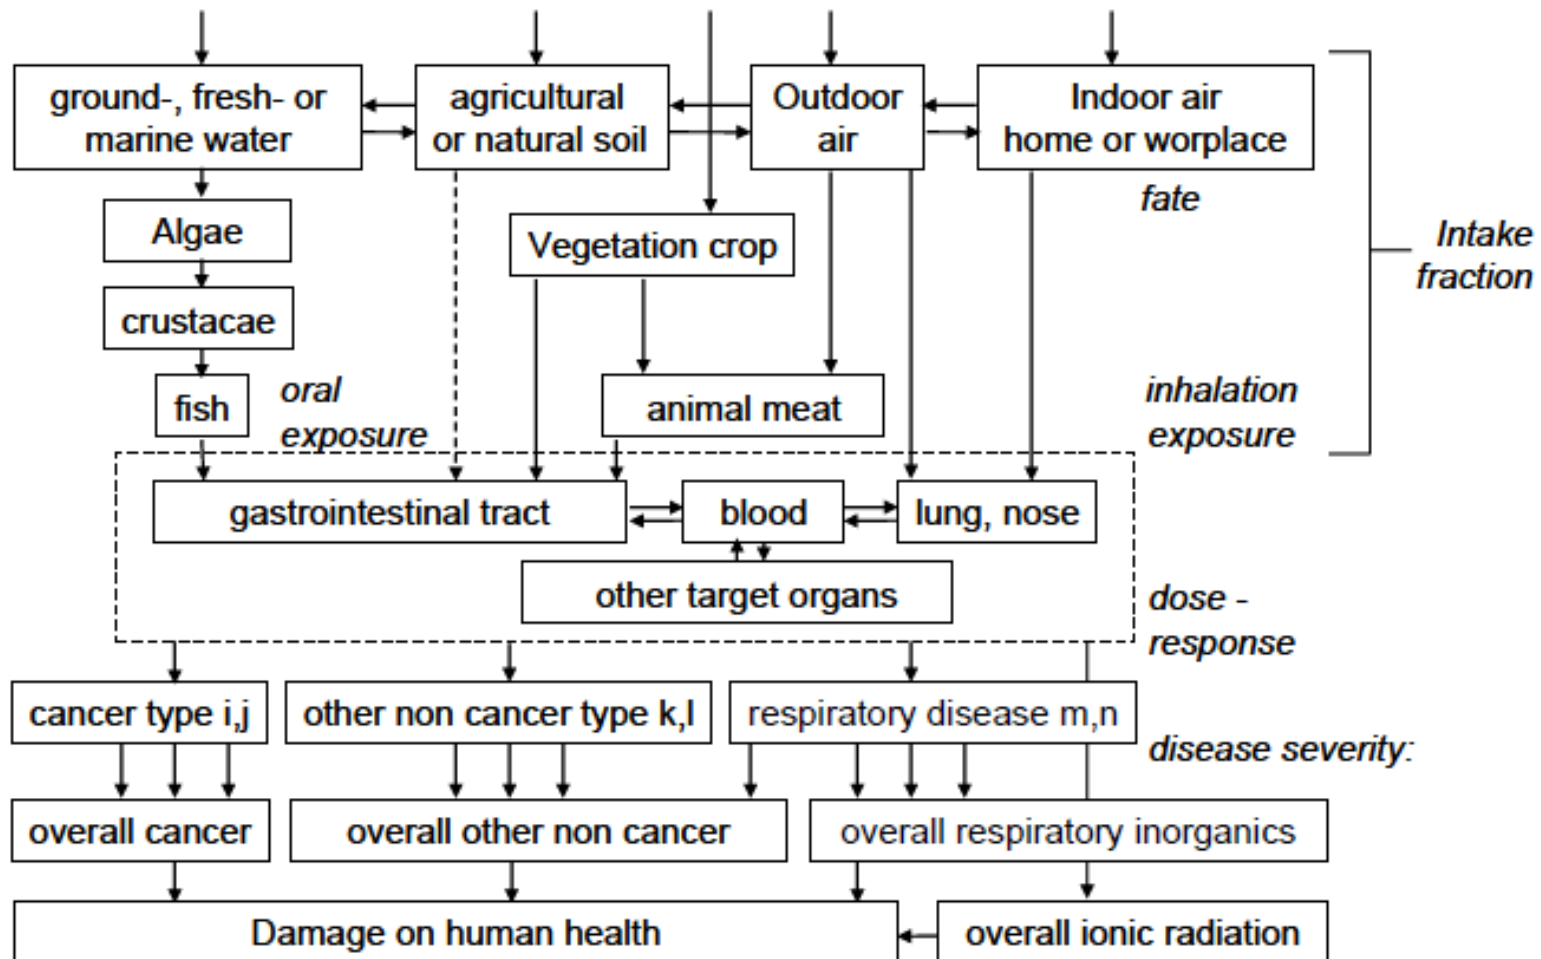

=> Characterization models derived from the risk assessment of chemical substances

# Impact category: human toxicity

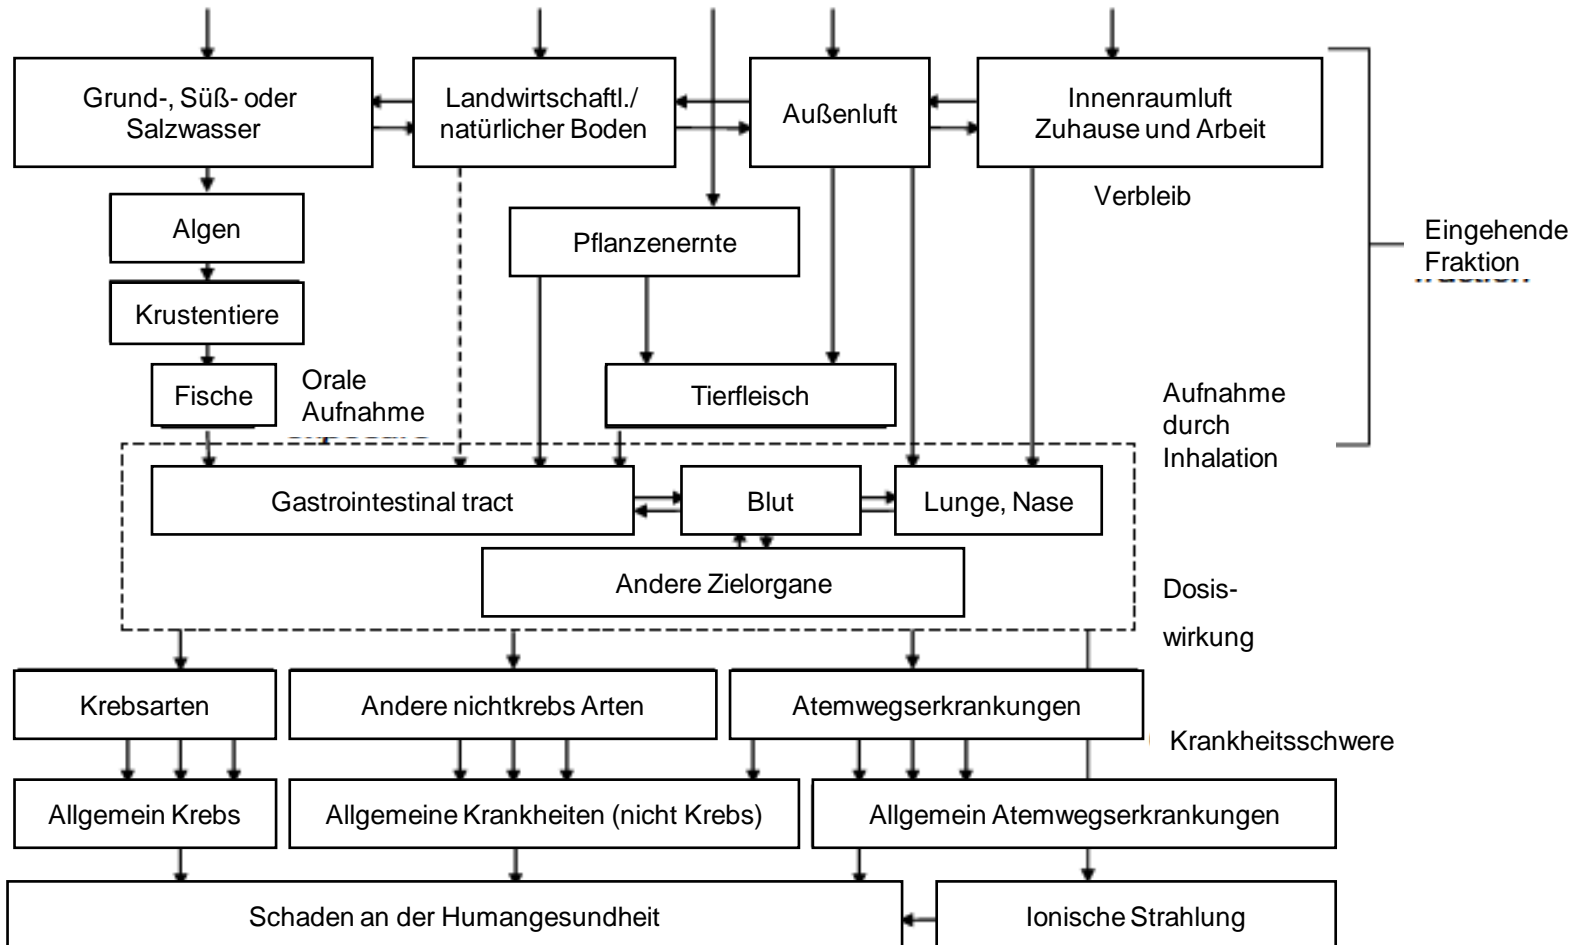

<b>Definition</b>	Assessment of toxic effects of substances on humans
<b>Impact indicator</b>	<ul style="list-style-type: none"><li>■ Problem: no common characteristics of chemicals known → no common indicator</li><li>■ Four subcategories: cancer, respiratory diseases, other non carcinogenic effects, effects to ionizing radiation</li></ul>
<b>Characterization model</b>	<ul style="list-style-type: none"><li>■ Consideration of the fate of chemicals in the environment, human intake and various toxicological responses (effects and severity)</li><li>■ Models: IMPACT 2002, IMPACT 2002+, CML 2001, ReCiPe 2008</li></ul>
<b>Characterization factor</b>	human toxicity potential (HTP)
<b>Unit</b>	<ul style="list-style-type: none"><li>■ YLL (= Years of Life Lost)</li><li>■ YLD (=Years of Life Disabled)</li></ul>
<b>Damage categories (Endpoint)</b>	Human health

# Impact category: human toxicity

Quelle: European Commission, 2010

# Impact category: human toxicity

Quelle: European Commission, 2010

## Simple weighting by boundary or guide values from the Health and Safety:

- In Germany often maximum allowable concentration are used (MAC) as quasi-midpoint indicators.
- Result: "Human toxicity potential" (HTP), describes a "critical volume human toxicity", i.e. the volume of air that is charged up to the MAC value.
- The HTP can be normalized to a reference substance, eg 1.4 dichlorobenzene

**Criticism:** MAK values include an certain latitude of judgement, i.e. they are "political" values

Acutely highly toxic substances may be overrated, since they are usually only emitted in accidents at high doses in the environment and therefore play for the exposure to the environmental media a minor role

## Characterization with additional estimation of exposure

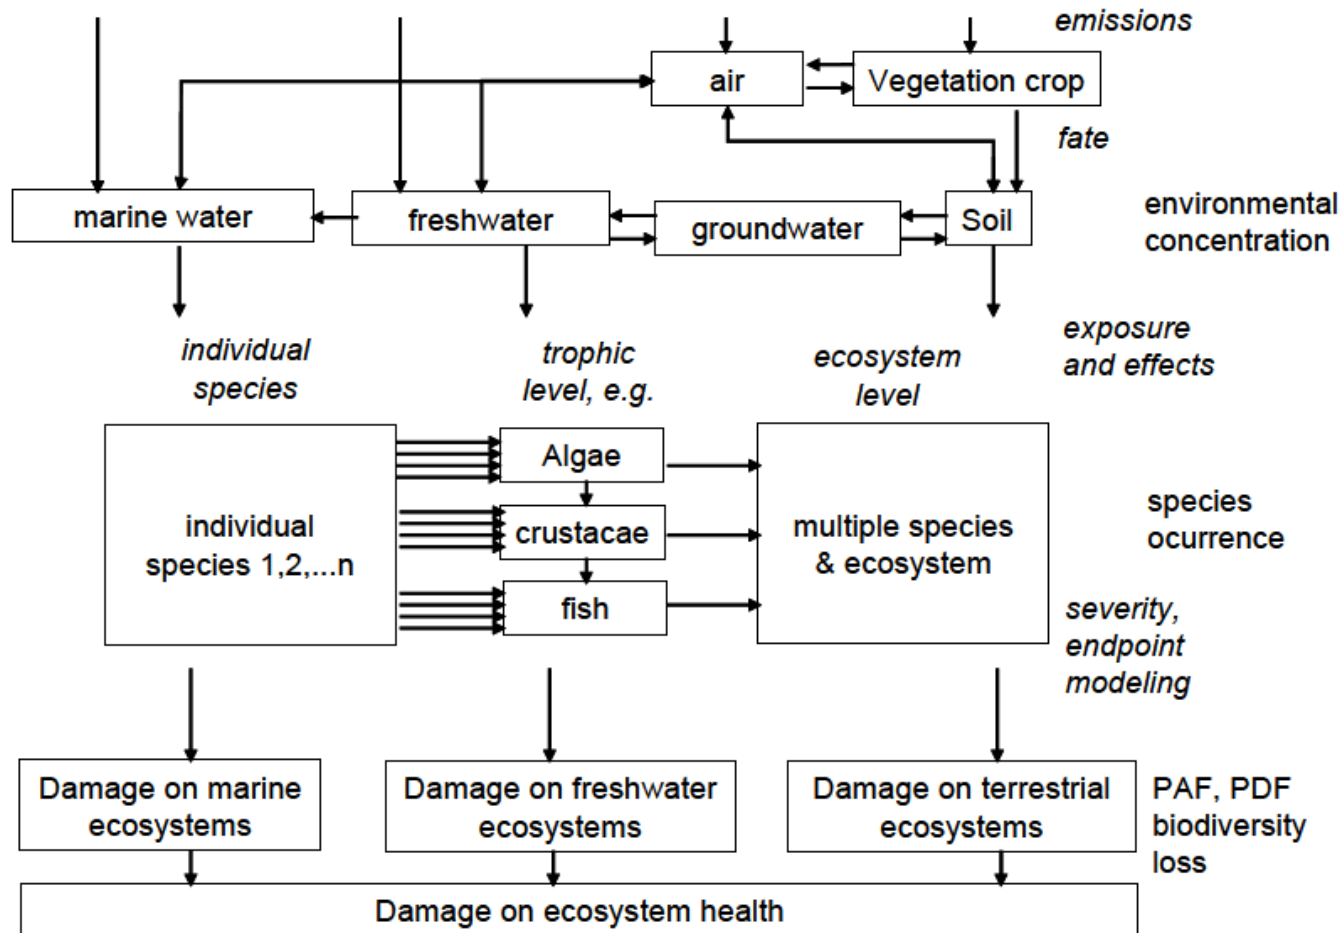

- Based on the, in the toxicology usual, analysis of uptake routes and includes the necessary chemicals in the exposure assessment analysis.
- In principle, the same approach for human- and ecotoxicity, based on the risk assessment of chemicals

**Problem: Many toxicity endpoints**

# Impact category: ecotoxicity

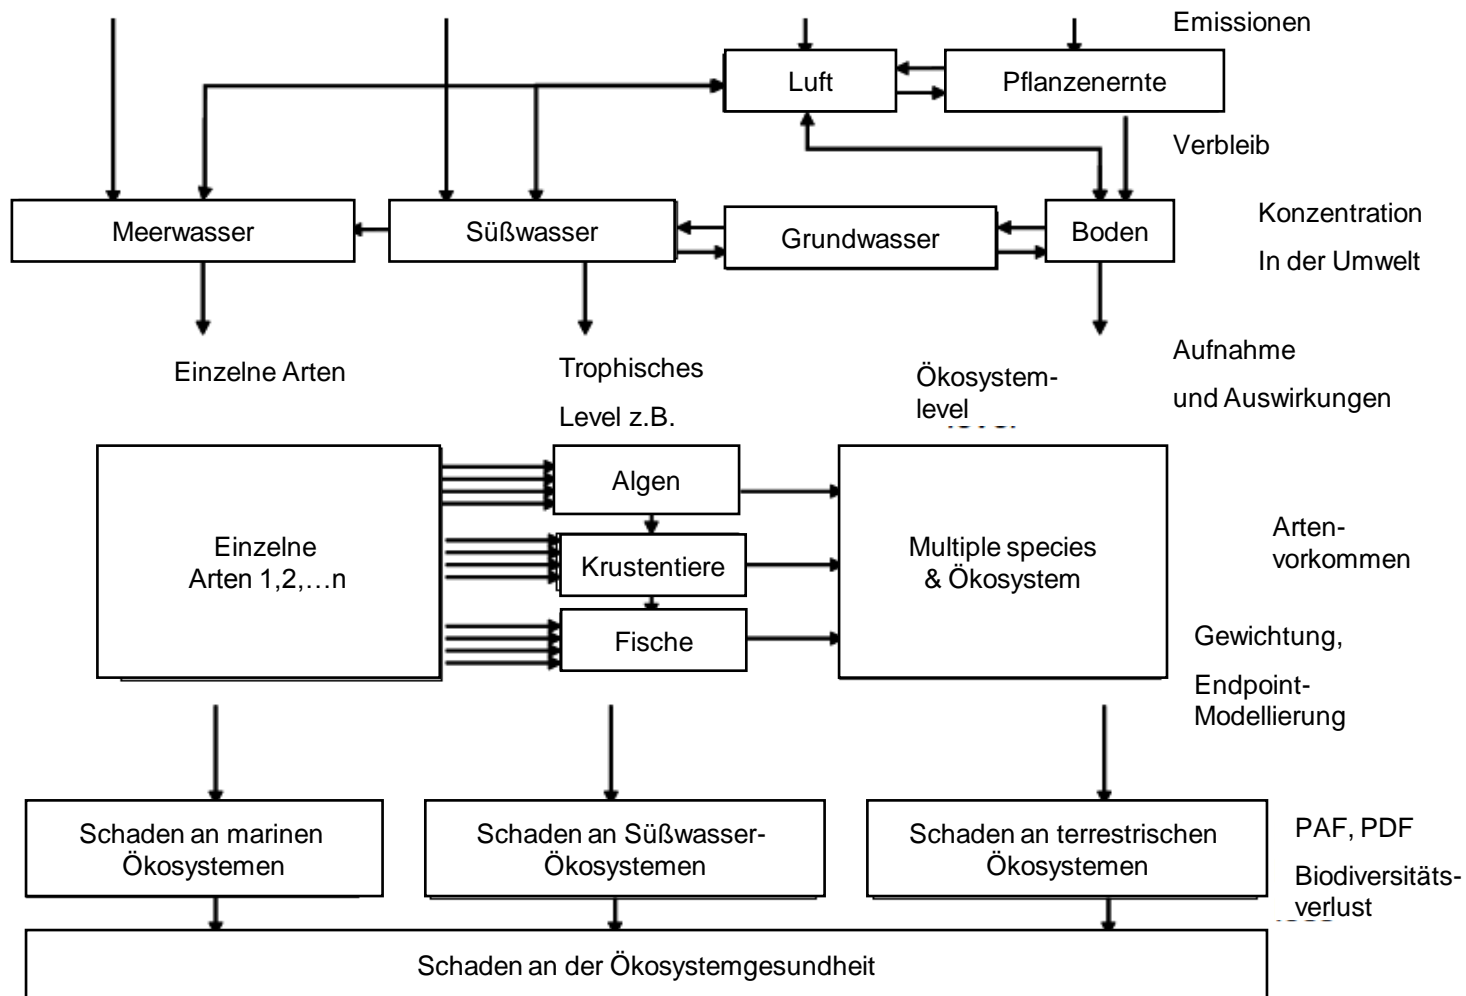

<b>Definition</b>	Assessment of the toxic effects of chemicals on an ecosystem
<b>Impact indicator</b>	Biodiversity loss / extinction of particular species
<b>Characterization model</b>	<ul style="list-style-type: none"><li>■ Consideration of the fate of chemicals in the environment, the inclusion of individual species and different toxicological responses (effects and severity)</li><li>■ Models: IMPACT 2002, IMPACT 2002+, CML 2001, ReCiPe 2008</li></ul>
<b>Characterization factor</b>	ecotoxicity potential
<b>Unit</b>	<ul style="list-style-type: none"><li>■ PDF (= Potentially Disappeared Fraction of species)</li><li>■ PAF (= Potentially Affected Fraction of species)</li></ul>
<b>Damage categories (Endpoint)</b>	Damage to the ecosystem quality (species extinction)

# Impact category: ecotoxicity

Quelle: European Commission, 2010

# Impact category: ecotoxicity

Quelle: European Commission, 2010

# Risk assessment of chemical substances

<i>What quantities of a substance are emitted?</i>	<i>Inventory Analysis</i>
How disperses the material in the environment?	Spreading, (distribution, accumulation, decomposition)
What quantities of a substance assimilate the organisms?	Exposure
What consequences does the inclusion of a substance have through an organism?	Toxicity

# spreading model CalTox

# Overview Impact categories

<i>Wirkungskategorie</i>	<i>Wirkungsindikator</i>	<i>Charakterisierungsfaktor</i>	<i>Einheit</i>	<i>Schadenskategorie</i>
<b>Klimawandel</b>	Infrarot-Strahlungsantrieb	Treibhauseffekt (GWP)	kg CO <sub>2</sub> -Äquivalente	Humangesundheit Ökosystemqualität
<b>Ozonabbau</b>	Stratosphärische Ozonkonzentration	Ozonabbaupotential	kg CFC-11-Äquivalente	Humangesundheit Ökosystemqualität
<b>Versauerung</b>	Säuregehalt durch H <sup>+</sup> -Ionen	Versauerungspotential	kg SO <sub>2</sub> -Äquivalente	Ökosystemqualität
<b>Eutrophierung</b>	Phosphor-/Stickstoffkonzentration	Eutrophierungspotential	kg PO <sub>4</sub> -Äquivalente	Ökosystemqualität
<b>Ökotoxizität</b>	Artensterben	Ökotoxizitätspotential	PDF/ PAF	Ökosystemqualität
<b>Humantoxizität</b>	Kein gemeinsamer Indikator	Humantoxizitätspotential	YLL & YLD	Humangesundheit
<b>Feinstaub</b>	TSP/ PM10/ PM2.5/ PM0.1	Feinstaubpotential	kg Feinstaub	Humangesundheit
<b>Ionisierende Strahlung</b>	Absorbierte Dosis	Ionisierendes Strahlungspotential	kg U <sup>235</sup>	Humangesundheit Ökosystemqualität
<b>Photochemische Ozonbildung</b>	Photochemische gebildetes Ozon	POCP oder MIR	kg NMVOC	Humangesundheit Ökosystemqualität
<b>Landnutzung</b>	Artenverlust	Landnutzungspotential	m <sup>2</sup> /a	Natürliche Ressourcen
<b>Ressourcenverbrauch</b>	(nicht-) erneuerbare Ressourcen	Ressourcenverbrauchspotential	m <sup>3</sup> oder kg oder MJ	Natürliche Ressourcen
